

UNDERBITE

WHAT IT IS & HOW IT CAN BE CORRECTED?

An underbite is a dental issue when the lower front teeth are positioned in front of the upper teeth when the mouth is closed.

Underbite can be caused by

Childhood Habits

Underbite Is Inherited

Permanent Damage to Jawbones Due to Injuries

Tumors On The Jawbones

Invisalign can treat the following conditions

Overbite

Gapped teeth

Moderate Underbite

Open bite

Crossbite

Crowded teeth

Can Invisalign fix an underbite?

One of the viable treatment options for an underbite, especially in adults, is the removable teeth aligner Invisalign.

Time to fix an underbite with Invisalign

Treatment for an underbite depends on multiple factors. On average, Invisalign treatment takes 12 to 18 months.

Benefits of Invisalign for an Underbite Correction

Nearly invisible and not noticeable while smiling

Easy to remove when eating or cleaning

Shorter treatment duration

Requires fewer visits to a dental office

Moves teeth more gradually than conventional metal braces
